

Medication-Induced Nutrient Depletion

Prescription medications work to alleviate symptoms because they disrupt certain biochemical pathways. However, do we take the time to consider what other effects they are having on us? By shutting down a biochemical pathway, you could be having an impact on the utilization of certain nutrients. Or by taking a particular drug, you could be stressing the liver resulting in the depletion of nutrients. All of these have an impact on our nutrient reserves and can contribute to the progression of chronic disease.
